Hacknite Design Track Problem Statement

General Instructions: You have to upload all required links and codes on GitHub. You also have to include a Project Report in the submission.

Now that the world has started to learn to live with COVID-19, the tourism and entertainment industry is returning to normal.
You/your team is/are required to create a website through which consumers can book flight/movie (either one) tickets. Create an initial template using Figma and then implement the same using React.

Requirements:
There are a few basic requirements that you will need to implement. You are more than welcome to add in extra features which make your website stand out.

Basic Requirements:
- Your website must consist of a minimum of 3 web pages.
- You must have a web-page where the customer can view a list of available flights/movies.

Please note that we do **not** expect any kind of back-end services. Therefore, any information that you wish to display on the screen (for example, list of flights/movies) can be dummy information(hard coded/typed onto the website).

Submission:
Submit your GitHub Repo Link in the following google form:
https://forms.gle/mLSehnFKbRmqaxQx5

Judging Criteria:
Your webpage will be judged based on visual appeal and usability. Please note that your React implementation holds more weight than your Figma design.
